VISIONNAIRE

Visionnaire developed a new layout for functions of the Muraski Imóveis management system

The Real Estate Management System was developed internally by the real estate company Muraski Imóveis and it is used by brokers in their sales and rental activities. It has an interface with approximately 30 screens.

The client was not satisfied with the layout and navigation organization, and it was necessary to carry out an evolving maintenance in order to make the use of the system simpler and more intuitive, which would allow greater productivity for brokers in carrying out their activities.

The service was provided in the outsourcing modality, managed by the contractor, using an agile development methodology, in which maintenance sprints were defined jointly by the parties, with great interaction between the development team and the system administrator.

The requested evolutions were delivered, resulting in better productivity of brokers. The technologies used in the system developed for the real estate company were PHP, Dojo Toolkit, MySQL database, HTML and CSS.
