

Visionnaire's solution allowed Unimed Curitiba's doctors to electronically send their fees

Unimed Curitiba needed to allow its members to carry out their fees related to surgical procedures or hospitalizations independently of the main provider. For this, there was a need for a partner company to carry out the implementations, divided into two parts: execution of fees by the members and analysis of fees sent by legal person by the member.

Through its expertise and a good relationship acquired in previous projects, Visionnaire developed the system that allowed the cooperated doctors of Unimed Curitiba to send their fees electronically, enabling the analysis and modification of possible submissions made by the providers.

The partnership between Visionnaire and Unimed Curitiba provided the necessary changes and implementations to meet the new process of submitting medical fees related to hospitalizations, independently by the members.

The technologies used for this project were: Java EE (JSF, EJB, JAAS), HTML5, CSS3, JavaScript, Apache Tomcat, PrimeFaces, WildFly Application Server and Oracle databases.
