

We developed apps that facilitate access to information and requests from Unimed beneficiaries

Unimed offered all the information related to its services in several service channels, so users had to perform searches to find which channel would meet their needs at any given time. As it already had web systems for its users, the need to integrate these services with mobile applications arose, with the mission to optimize and facilitate the whole process.

Visionnaire was responsible, as a technological partner of the Unimed, in the creation and development of an app with the main purpose of bringing the services offered by Unimed to users' hands for quick access and without difficulties and bureaucracies. This solution was developed for Android and iOS platform, unifying various information in three applications.

With the new family of mobile applications (apps) developed in partnership with Unimed, its clients and medical doctors enjoy several functionalities, all integrated with Unimed's main services.

For the clients, in the Unimed Client App it is possible to perform card unblocking, authorization, exam requests, online scheduling, check attendance units and contact telephones.

For the doctors, in the Unimed Doctors App, it is possible to do information change, demonstration of tax obligations, part quotas, fee management, events, benefits, news and get service units and laboratories information. And in the Unimed Good Living App it is possible to receive specific health guidelines for your profile, as well as easy access to information related to the health programs in which they participate.
