## **Success Case**

Specification for System  
Migration to the Cloud

# Problem

Abix Tecnologia needed to migrate a management solution to a more modern technology and prepare updated documentation for the new solution to enable the system's migration to a Web platform.

# Solution

Abix, which already had a specialized IT team, implemented its new system using its own infrastructure with the aim of operating it in the cloud for all branches. The system specification involved studying existing documentation, interviewing users and developers of the previous system, analyzing usage and gathering requirements.

# Results

With the extensive documentation prepared by Visionnaire, Abix's IT department obtained precise inputs for estimating the development effort needed to migrate the Pro Radius system.
