

VISIONNAIRE

Success Case

Consultancy for Technical System Documentation

Problem

The system used by Peróxidos do Brasil for managing inventory, loading, and billing had its respective User Manual, however, there was no technical documentation for it, something fundamental for the development and implementation cycles of systems, although not mandatory under Brazilian laws.

Solution

Visionnaire analyzed all the source code of the inventory, loading, and billing management system and wrote the technical document based on the studies carried out.

The document describes the system's main flows and its main functions (methods). It also contains a macro diagram of the architecture, including the architecture for integrating with other systems.

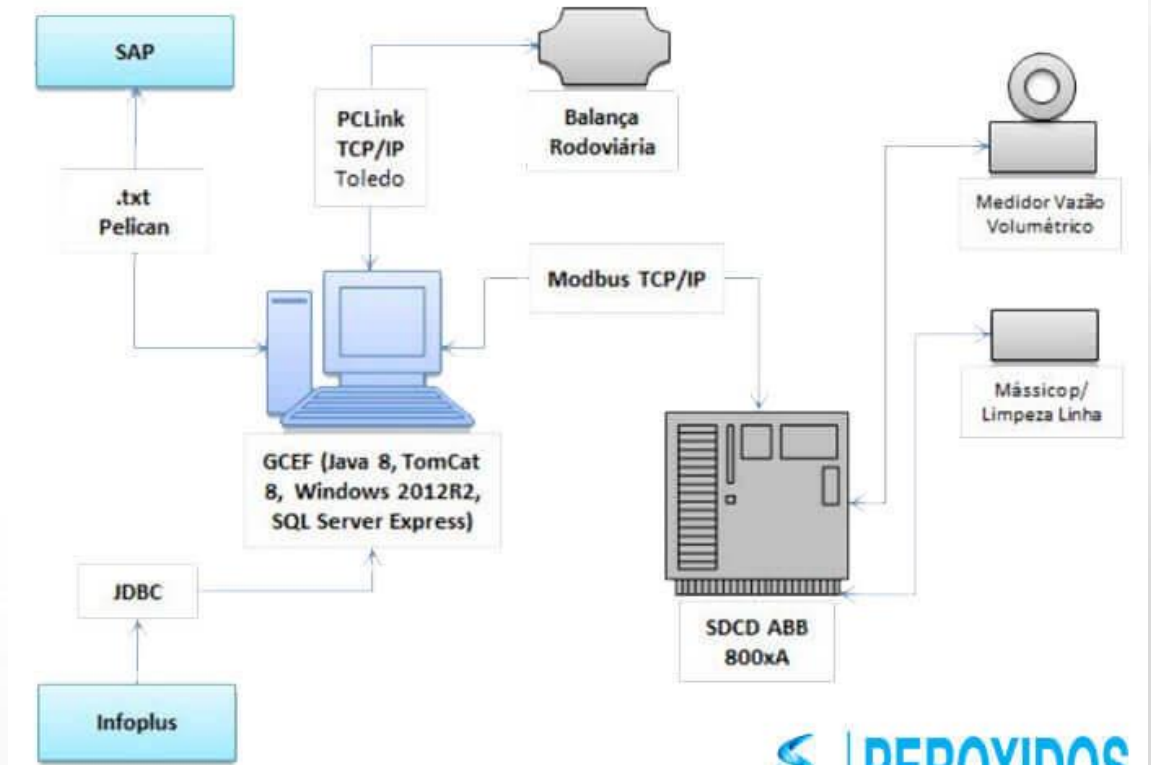

Results

Peróxidos do Brasil now owns, in addition to the User Manual, the details of the technical aspects of such an important tool for the company's flows.

All those who make use or are responsible for maintaining the system now have more detailed guidelines, facilitating the understanding of the tool.
