Success Case

Extension for a Financial Transaction Processing Solution

Problem

Make it possible to carry out transaction configurations and parameterizations in a financial transaction processing system even without the presence of a complete development environment and with greater productivity.

VISIONNAIRE

Solution

Visionnaire created a friendly and intuitive Graphical User Interface (GUI) that, even without a complete development environment, allows configurations and parameterizations to be carried out in the financial transaction processing system. Thus, it became possible to carry out maintenance in advance and schedule deployments of previously developed configurations.

VISIONNAIRE

Results

With the Graphical User Interface (GUI) developed by Visionnaire, it became faster to perform maintenance tasks in the financial transaction processing system, and productivity increased significantly for some specific tasks. It has also become possible to schedule the implementation of previously developed configurations.
